

# Technical Paths and Check Lists

We need to add extra features to existing IAM service

1.Approval Mechanism

2.Notification Mechanism system to handle all type of notification configured with Plat form like Email,Whatsapp,telegram,android push,ios push notifications

3.Seperate file handling service for file manipulation and storage and retrival using (Digital Ocean Spaces/AWS S3)

4.we need to create a CMS like tool to create Crud Operations with present existing CRUD Model we are using in both frontend and backend

5.Would like to join my hands with devops team for CI/CD automation

6.we should have one web-client Proxy service for by passing auth in service-to-service communication and user client(front-end) to service communication

Before start Coding Understand the Problem if you have even a dumb question on it raise it.

- You should follow Eslint rules and every Project should be configured to certain formatter either Prettier or Js
- Every Project should have Lint Issue fixer and Format fixer script configured in package.json scripts
- There should not be any unwanted imports in your file
- When ever a new package is going to be installed you sould get approval from you TL
- variable names will always starts from lower case and variable name should define it's meaning and Purpose not like let a,const b like that
- Class Names should start from Capital case
- Always Follow S.O.L.I.D principles and DRY rule
- before saving files always click `shift+alt+f` and `shift+alt+o`
